Assignment Details: Build a Conversational SHL Assessment Recommender

Did your solution meet all the following expectations? (If any of the below are missing, the solution might be considered incomplete or subject to rejection)

1. Built an API using LLM and/or RAG techniques that can ask clarifying questions, return relevant SHL assessment recommendations, refine results when user constraints change, and compare assessments using catalog evidence.
2. Included evaluation methods to measure retrieval quality, recommendation relevance, groundedness, and overall response accuracy and effectiveness.

- ◯ Yes
- ◯ No

Provide the public base URL of your deployed API service, where GET /health and POST /chat are both accessible.

Does your deployed API have a cold-start delay after inactivity?

- ◯ If yes, please provide the approximate time for the first response in seconds below
- ◯ No

If applicable, please provide the name of the LLM used in your implementation.

Did you use AI to help implement this assessment? If yes, what tools did you use?

Please upload a PDF (maximum 2 pages) summarizing your approach to solving the problem. Include your design choices, retrieval setup, prompt design, evaluation method, what did not work, and how you measured improvement.
